

Why Clinical Trials are Important

We are committed to finding safe, more effective treatments to help patients with cancer live better and longer lives through [clinical trials](#).

Until we find a cure for cancer, we will always require patient volunteers to participate in clinical trials.

Every approved medication and treatment used today has first gone through a clinical trial to ensure it is safe and effective.

Modern medical treatments are given based on evidence or proof they work. Clinical trials are an important way of gathering this evidence. As a result, people who have cancer today are living longer and enjoying a better quality of life.
